## Reviews

*This publication will be worth purchasing. It really is written in simple terms instead of difficult to understand. It's been designed in an exceptionally simple way and is particularly only right after i finished reading this ebook in which basically modified me, alter the way i believe.*

Loomis, Essex and Meacham (Jour. Amer. Chem. Soc. 39, 1133 (1917) and Ming Chow (ibid. 42,488 (1920), have also measured cells of the same type containing hydrochloric acid and potassium chloride, but in their measurements the total chlorine ion concentration was kept constant. In the present investigation accurate measurements of the same types of cells have been made, employing barium, strontium and calcium chlorides in 0.1 M hydrochloric acid. The exact calculation of the individual activity coefficients of the ions in concentrated solutions is a problem accompanied with great difficulties owing to liquid junction potentials which cannot be accurately calculated. At the present time, the only other method of value, besides calculations which are inexact, is to eliminate as far as possible the liquid junction potential by the use of a saturated potassium chloride solution. Although this error due to liquid junction is appreciable, and the calculations cannot be regarded as exact, it is thought that further experimental work of this nature is of very great value, particularly since no other method has yet been found which can approach it in accuracy.
